

Adapting to the new norm of low global oil prices, prudent investment on the economically viable project is crucial for all Oil and Gas companies to remain relevant in the business.

One way of achieving this is to drive down the cost through advancement of technologies. Since then, technology in PETRONAS took a dramatic role; from mainly supporting the business to be more reactive, anticipate and lead. This include entering into partnerships with businesses and giant Oil and Gas players to achieve operational excellence.

Guided by technology focus areas and its strategic technology objectives, PETRONAS Technology Agenda strives to unlock the considerable potentials of technology to ensure long term business positioning and sustainability. In this presentation, we will share numerous technologies, including award winning solutions for offshore facilities from Enhanced Oil Recovery (EOR), gas sustainability, Facilities of Future (FOF), geoimaging and unconventional technology that have resulted in hundreds of millions in cost savings.
